Development of Germany-wide Distribution of combined heat and power (CHP) plants based on locally produced hydrogen. In this Type of combined heat and power, electricity and Heat are efficiently generated without the Use of conventional fossil Energy Sources such as Liquefied petroleum gas, Heating oil, natural Gas or Coal. This Method is used for the first time in Germany for the first time.

The Principle. Conventional Water from The Ground, River, lake, Sea or stream is treated and demineralized. The water is then Split into Hydrogen and Oxygen using Resonance Technology. The subsequent hydrogen modification with an Additive is used to supply the enriched Gas Mixture to the Gas Turbine. For Flame Control, water is added To the Process, which evaporates in the process. The resulting Water vapour drives downstream ORC generators.
