## **Wave power plant**

Our unique wave power plant is a cost effective solution to generate electricity from the moving water.

Gathering ideas for many years and a long time of development are behind us until we have developed this unique power plant.

Our patented wave power plant can produce electricity for just 1 cents / kWh, and thus this represents the cost-effective renewable energy that is currently available.

Even with the smallest movements, electricity is generated, no matter in which direction. Also, the maintenance-free, as one of the important points. Due to the simple yet very good construction, we can offer our products with a 10-year warranty.

The main application area will be for energy generation for large projects in the oceans. The current wind and wave power plants are currently very expensive and, above all, require a high level of maintenance. Even with larger waves, the wave power plants tend to turn off or are often broken.

That's why we see a good opportunity here at short notice.

In addition, power is generated during all movements, so it would also be possible to supply boats (no matter which size) with electricity.

Further ideas are planned and can be discussed in a personal conversation.

We are looking for partners who are interested in introducing our products in other countries (outside of Germany) as license partners in one country.

The license partnership is also awarded exclusive, if interested.

We look forward to hearing from you.
